The ultimate solution
for better concentration

Modern life is built on plenty activities, even in professional than personal area, and that means people to be focused on what they do, and further keep concentration.

Moreover, this can also be strengthened and increased by health diseases, more than activities only, affecting millions of people around the world. This is called Attention-deficit/hyperactivity disorder, or ADHD acronym, and include having a hard time paying attention, being hyperactive and being impulsive.

15% of EU citizens (Eurostat 2022 data) report moderate to severe difficulties with concentration or memory, which is similar to the situation in France. 5% of the world population have a ADHD (Attention Deficit Hyperactivity Disorder) so a large number of people have this illness, so scientists want to cure this and find solutions, thanks to actual technologies.

Before that, people who have an ADHD trouble took a treatment like pills.

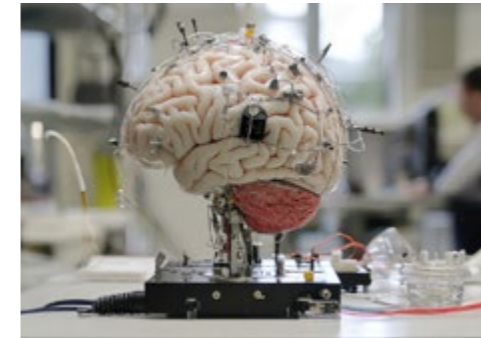

Now the director of Intelligent Robotics Laboratory, Hiroshi Ishiguro confirmed this innovation « *is fabulous* » he said to our article.

Some famous people like Billie Eilish, singer, Emma Watson, actress, and Michael Phelps, olympic medallist athlete, have approved this revolutionary object to help them.

The fact is that with new equipment, they can concentrate better and reach their goal more easily. Scientists observed a decrease in percentages, as they tested this new device on more than two hundred people, which allowed them to scientifically prove its effectiveness.

This project might be spread to disappear addictions (drugs, alcohol, screens, food,...).

That's why our internal scientist team have decided to look into this subject.

Nowadays, new technologies have been developed to help in daily activities that requires full time attention.

Some specialized brand are working hard for solution, simple to use and to manage.

Focusband is the new innovation which change your life in better.

This invention allows people to keep attention of children, teenagers and adults during studies and long tasks. Also, thanks to this brand new headband, illness like Alzheimer's disease, a degenerative disease which slowly destroys brain cells and affects

memory, can be freezed and keep brain activities up.

This device can help reduce symptoms of hyperactivity, inattentiveness, and impulsivity, has seen for ADHD trouble.

Another application appears with students that can't do without the headband to keep concentration working. It became essential for this new generation because it helps the concentration by stimulating brain cells, which is really important in every day life.

Moreover that innovation allows to create many other solutions which improves the world.

FOCUSBAND : AN EQUIPMENT FOR ALL YOUR TROUBLE

Focusband is consisting of 3 devices : a headband, a local remote and an app for mobile phone.
By this way, customers can control intensity of signals outputs, or music volume.

This will send electrical signals directly to the cognitive area of the brain, in the hippocampus which is part of the memory system, using two small electrodes included into the headband that would emit varying levels of electrical stimulation.

The remote control sold with the headband has many functionality. Customers can listen to music or a prerecorded sound to relax, choose the power of the electrodes, use some programs that are recorded into the machine.

About the mobile application, it works with bluetooth link with the headband. Our scientist team usually add updates for it to match more with our users and

their daily habits.

Moreover this app on the mobile phone contains two buttons one to activate the electrical signals and an other button to play music in order to de-stress people.

Focusband will put progress into your lifestyle

This device is beneficial for people suffering from Alzheimer's disease, like cognitive impairments such as alcoholism or several other conditions.

The headband is accessible, so all people with this disorder can buy it.

The french health insurance AG2R la mondiale offers this headband to people who are suffering of ADHD troubles.

Has a scientific production our team have a certified site where buyers can buy.

Check this for further informations on www.focusbrand.com

Thanks for reading this article, we hope you found it delightful and the subject interesting. Unfortunately the modern device described is a fake but some scientist will make it real soon because some works are still running at this time.

The last three images were generated by AI

Tout d'abord, nous avons réalisé ce bandeau connecté pour répondre à un besoin de la société. En effet, de nos jours, on remarque de plus en plus de troubles de l'attention liés par exemple à l'utilisation excessive de nos téléphones portables.

De plus, selon nous, si cette invention existait, elle serait d'une grande aide au quotidien : elle nous permettrait de nous concentrer davantage sur des tâches complexes et longues.

Nous souhaitons créer une innovation simple d'utilisation pour permettre au plus grand nombre de s'en servir. Par exemple, on retrouve un système de serrage s'adaptant à toutes les têtes et formes de visages, une application et une télécommande facile à prendre en main.

Pour ce qui est de la mise en page, nous avons choisi d'exposer notre projet sous la forme d'un article afin de montrer davantage de crédibilité et de sérieux à l'égard de celui-ci.

En outre, quelques recherches ont été menées pour apporter plus de fiabilité à notre article. Nous avons également pris la liberté de nommer des personnalités qui sont touchées par le trouble déficit de l'attention afin d'illustrer notre propos et de toucher un plus grand nombre de personnes. Nous souhaitons également que des scientifiques s'intéressent à notre sujet afin qu'il réalise l'innovation !

Enfin, faute d'alternative et d'images préexistantes, les trois dernières images de l'article ont été générés par une intelligence artificielle (ChatGPT) pour illustrer notre innovation. Nous garantissons que le texte a été écrit par nos propres soins sans (re)formulation par IA.
